

Ultherapy Offers an Anti-Aging Alternative

By VALISV 01.30.2012

"Ultherapy is unique in its ability to deliver heat to the deepest support structures of the skin – which was never able to be accomplished before without surgery."

– Dr. Elizabeth Tanzi

Going under the knife or getting Botox may seem like a drastic way to get rid of aging signs, but a refreshed and youthful look doesn't require any downtime. **Ulthera** is a new technology that provides a lifting effect and it is the first FDA approved noninvasive face treatment.

According to leading dermatologist and Ultherapy practitioner, Dr. Elizabeth Tanzi, it is the first technology to penetrate the skin's layers with energy to recondition and strengthen the skin's support structures of collagen fibers.

"Ultherapy is unique in its ability to deliver heat to the deepest support structures of the skin – which was never able to be accomplished before without surgery," she explained.

With one session results can start immediately with some skin contraction and firming, and over a period of two to three months, the skin will naturally build itself back up and shift for a more youthful appearance without looking like you had work done.

There is no need to worry about risks or serious side effects. Since the therapy is energy based, it can work on any skin type or tone without the risk of irritation or hyperpigmentation.

"The area may be slightly sore and a little swollen after treatment, but most patients are able to resume regular activities immediately after treatment," Dr. Tanzi said.
